

AI Assistant Coding

Assignment 1.1

Name : G. Hari Priya HT. No : 2303A51104

Batch: 1

Task 1: AI-Generated Logic Without Modularization (Factorial without Functions)

Scenario: You are building a **small command-line utility** for a startup intern onboarding task. The program is simple and must be written quickly without modular design.

Task Description: Use GitHub Copilot to generate a Python program that computes a mathematical product-based value (factorial-like logic) directly in the main execution flow, without using any user-defined functions.=

Constraint:

- Do not define any custom function
- Logic must be implemented using loops and variables only

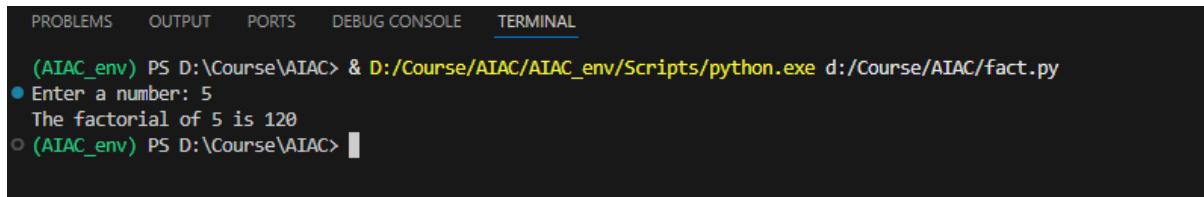

Prompt:

The screenshot shows the GitHub Copilot interface. A file named 'fact.py' is open. The code completion window is displayed, containing the instruction: 'write a python rogarm to find the factorial of a number using lops and variable only donts define any functions|'. Below the code completion window, there are buttons for 'Ask' and 'Auto', and a 'Run' button.

Code:

```
1 # Get the number from user input
2 n = int(input("Enter a number: "))
3
4 # Initialize factorial to 1
5 factorial = 1
6
7 # Use a loop to calculate factorial
8 for i in range(1, n + 1):
9     factorial *= i
0
1 # Print the result
2 print(f"The factorial of {n} is {factorial}")
```

Output:

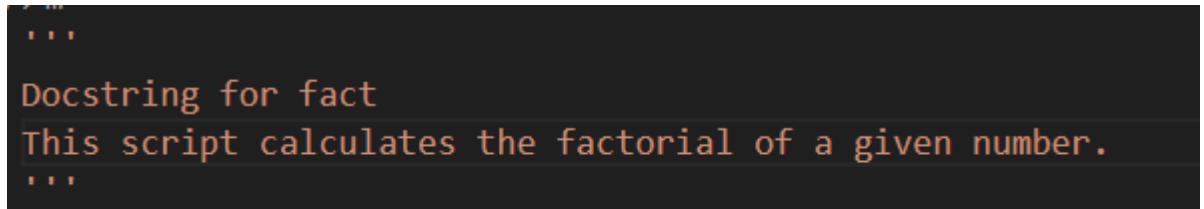

PROBLEMS OUTPUT PORTS DEBUG CONSOLE TERMINAL

(AIAC_env) PS D:\Course\AIAC> & D:/Course/AIAC/AIAC_env/Scripts/python.exe d:/Course/AIAC/fact.py

- Enter a number: 5
- The factorial of 5 is 120
- (AIAC_env) PS D:\Course\AIAC>

Copilot Suggestions:

```
'''  
...  
  
Docstring for fact  
This script calculates the factorial of a given number.  
'''
```

Explanation:

The code generated from compile was well structured and for beginner it was very helpful. It reduces coding time and gives code without any logical or syntax error.

Task 2: AI Code Optimization & Cleanup (Improving Efficiency)

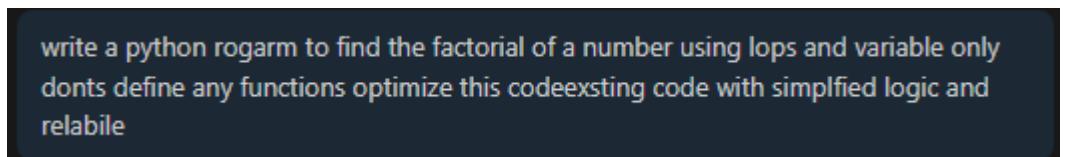

Scenario: Your team lead asks you to **review AI-generated code** before committing it to a shared repository.

Task Description : Analyze the code generated in **Task 1** and use Copilot again to:

- Reduce unnecessary variables
- Improve loop clarity
- Enhance readability and efficiency

Hint: Prompt Copilot with phrases like “*optimize this code*”, “*simplify logic*”, or “*make it more readable*”

Prompt:

write a python program to find the factorial of a number using loops and variable only
don't define any functions optimize this code existing code with simplified logic and
reliable

Code:

```
# Get the number from user input
n = int(input("Enter a number: "))

# Handle edge cases for reliability
if n < 0:
    print("Factorial is not defined for negative numbers.")
elif n == 0:
    print("The factorial of 0 is 1")
else:
    # Initialize factorial to 1
    factorial = 1
    # Use a loop to calculate factorial (simplified and efficient for small n)
    for i in range(1, n + 1):
        factorial *= i
    # Print the result
    print(f"The factorial of {n} is {factorial}")
```

Output:

```
(AIAC_env) PS D:\Course\AIAC> & D:/Course/AIAC/AIAC_env/Scripts/python.exe d:/Course/AIAC/fact.py
● Enter a number: 6
The factorial of 6 is 720
○ (AIAC_env) PS D:\Course\AIAC> █
```

Explanation:

Compared to previous code this code was most efficient as it handles the edge case for negative and zero input

Task 3: Modular Design Using AI Assistance (Factorial with Functions)

Scenario: The same logic now needs to be reused in **multiple scripts**.

Task Description: Use GitHub Copilot to generate a **modular version** of the program by:

- Creating a **user-defined function**
- Calling the function from the main block

Constraints

- Use meaningful function and variable names
- Include inline comments (preferably suggested by Copilot)

Prompt:

The screenshot shows a code editor window with a dark theme. At the top, there are three tabs: a file icon, 'fact.py', and a close button. Below the tabs, a text area contains the following prompt:
convert this factorial program into functions with function and variable names and calling from the main block with proper inline comments for readability

Code:

```
def get_number() -> int:
    """Prompt the user to enter a number and return it as an integer."""
    return int(input("Enter a number: "))

def calculate_factorial(n: int) -> int:
    """Calculate the factorial of n using a loop. Assumes n >= 0."""
    factorial = 1 # Initialize factorial to 1
    for i in range(1, n + 1): # Loop from 1 to n inclusive
        factorial *= i # Multiply factorial by current i
    return factorial

def main():
    """Main function to handle the program logic."""
    n = get_number() # Get the number from user input
    if n < 0:
        print("Factorial is not defined for negative numbers.") # Handle negative input
    elif n == 0:
        print("The factorial of 0 is 1") # Special case for 0
    else:
        result = calculate_factorial(n) # Calculate factorial
        print(f"The factorial of {n} is {result}") # Print the result

if __name__ == "__main__":
    main() # Call main function when script is run directly
```

Output:

```
(AIAC_env) PS D:\Course\AIAC> & D:/Course/AIAC/AIAC_env/Scripts/python.exe d:/Course/AIAC/fact.py
Enter a number: 7
The factorial of 7 is 5040
(AIAC_env) PS D:\Course\AIAC>
```

Explanation:

The code is converted into different functions with main block calling and improving readability

Task 4: Comparative Analysis – Procedural vs Modular AI Code (With vs Without Functions)

Scenario

As part of a **code review meeting**, you are asked to justify design choices.

Task Description

Compare the **non-function** and **function-based** Copilot-generated programs on the following criteria:

- Logic clarity
- Reusability
- Debugging ease
- Suitability for large projects
- AI dependency risk

	Without Functions	With Functions
Logic Clarity	Logic is written in a single flow, easy to understand but becomes unreadable as lines increases.	Logic is divided into functions, making the code to read & understand easily.
Reusability	Code cannot be reused	Functions can be reused in other programs without writing the logic again.
Debugging Ease	Debugging becomes hard as all the logic at one place	Debugging becomes easy as all the logic written multiple functions
Suitability for Large Projects	Not suitable for large projects	Suitable for large projects due to proper structure
AI Dependency Risk	Higher risk for long procedural code, hard to review or modify.	Lower risk generated in functions, easy to review & Modify.

Task 5: AI-Generated Iterative vs Recursive Thinking

Scenario: Your mentor wants to test how well AI understands different computational paradigms.

Task Description: Prompt Copilot to generate:

An **iterative** version of the logic

A **recursive** version of the same logic

Constraints :Both implementations must produce identical outputs

Students must **not manually write the code first**

❖ Expected Deliverables

Two AI-generated implementations

Execution flow explanation (in your own words)

Comparison covering:

- Readability
- Stack usage
- Performance implications

When recursion is *not* recommended

Iterative:

Prompt:

Code:

```

factorial > ...
# write code to compute factorial of a number without using recursion and handle invalid
input
def compute_factorial(n):
    ...
    Docstring for compute_factorial

    :param n: non-negative integer
    :return: factorial of n
    ...

    if not isinstance(n, int) or n < 0:
        return "Invalid input. Please enter a non-negative integer."

    factorial = 1
    for i in range(1, n + 1):
        factorial *= i
    return factorial

# Example usage
if __name__ == "__main__":
    user_input = input("Enter a non-negative integer to compute its factorial: ")
    try:
        number = int(user_input)
        result = compute_factorial(number)
        print(f"The factorial of {number} is: {result}")
    except ValueError:
        print("Invalid input. Please enter a valid non-negative integer.")

```

Output:

```

PROBLEMS OUTPUT PORTS DEBUG CONSOLE TERMINAL

● (AIAC_env) PS D:\Course\AIAC> & D:/Course/AIAC/AIAC env/Scripts/python.exe d:/Course/AIAC/factorial.py
Enter a non-negative integer to compute its factorial: 8
The factorial of 8 is: 40320
○ (AIAC_env) PS D:\Course\AIAC>

```

Recursive:

Prompt:

```

Recrsive.py X
write python progarm of factorial in recursive approach

Ask Auto ↗ ➤

```

Code:

```

Recursion.py
1 def factorial_recursive(n: int) -> int:
2     """Calculate the factorial of n using recursion."""
3     if n == 0 or n == 1:
4         return 1 # Base case: factorial of 0 or 1 is 1
5     else:
6         return n * factorial_recursive(n - 1) # Recursive case
7
8 def main():
9     """Main function to handle the program logic."""
10    n = int(input("Enter a number: ")) # Get the number from user input
11    if n < 0:
12        print("Factorial is not defined for negative numbers.") # Handle negative input
13    else:
14        result = factorial_recursive(n) # Calculate factorial recursively
15        print(f"The factorial of {n} is {result}") # Print the result
16
17 if __name__ == "__main__":
18     main() # Call main function when script is run directly

```

Output:

```

PROBLEMS OUTPUT PORTS DEBUG CONSOLE TERMINAL

● (AIAC_env) PS D:\Course\AIAC> & D:/Course/AIAC/AIAC_env/Scripts/python.exe d:/Course/AIAC/Recirsive.py
Enter a number: 9
The factorial of 9 is 362880
● (AIAC_env) PS D:\Course\AIAC>

```

	Iterative Approach	Recursive Approach
Readability	Easy to understand for beginners	harder for beginners due to function calls
Stack Usage	Uses constant memory	Uses call stack for each function call
Performance	Faster and more memory-efficient	slower due to function call overhead
